

Constructing A Custom Tracking Link

Table of Contents

- Keyword Tracking Links
- Sub-Affiliate Tracking Links
- Alternate Incoming Page Links
- Construct A Complex Link

Keyword Tracking Links

Accepted Variable Names: **tid1**, **tid2**, **tid3** and **tid4**

Example: [tid1=google&tid2=shoes&tid3=kids&tid4=blue](#)

By creating a custom tracking link you are able to track the success of your affiliate campaigns. You can use up to 4 different Tracking IDs (tids) and you can generate a report for each tracking link you create. The report will give you statistics just for the tracking link selected. Using this feature you can check how many clicks the link has received, number of commissions generated, amount of earnings generated, etc. You can also view the individual tracking log for each link created. Creating a keyword tracking link is easy but a few rules must be followed.

Keyword Data Type Rules

- Keyword cannot be more than 25 characters in length.
- Keyword may only contain letters, numbers, underscore and hyphens.
- No spaces are permitted in the keywords.
- The variables tid1, tid2, tid3 and tid4 must be lowercase.

Valid Example: **tid1=google_ad-words1**

Invalid Example 1: **TID1=google** (TID is uppercase)

Invalid Example 2: **tid1=google adwords** (there is a space between google and adwords)

Invalid Example 3: **tid1=google&adwords** (the & symbol is not allowed, only underscore and hyphen is allowed)

If your link contains a space, an illegal character or is too long, it will be ignored and not used.

Sub-Affiliate Links

Accepted Variable Name: **sub_id**

Example: [sub_id=1](#)

Using the Sub-Affiliate linking feature allows you to distribute links to your own affiliate network so your own affiliates can market for you as well. By adding the sub_id variable to your link, you can generate reports to see which of your own affiliates have generated sales for you. The available reports can be used to determine which affiliate generated the commission so in turn you can issue a commission to your own affiliate.

Keyword Data Type Rules

- Sub-ID cannot be more than 25 characters in length.
- Sub-ID may only contain letters, numbers, underscore and hyphens.
- No spaces are permitted in the Sub-ID.
- The variable sub_id must be lowercase.

Valid Example: **sub_id=165**

Valid Example: **sub_id=Johnson**

Invalid Example 1: **SUB_ID=165** (Sub-ID is uppercase)

Invalid Example 2: **sub_id=165 Johnson** (there is a space between 165 and Johnson)

Invalid Example 3: **sub_id=165{Johnson}** (the {} symbols are not allowed, only underscore and hyphen is allowed)

If your link contains a space, an illegal character or is too long, it will be ignored and not used.

Alternate Incoming Page Links

Accepted Variable Name: **url**

Example: [url=327462873](#)

When you create the URL link, the URL itself is stored in our database and assigned an ID number. The ID number is what you'll use in your links. This keeps things neat and simple.

Construct A Complex Link

So now that we know all the custom variables available to us, we can actually combine them to create complex links and obtain more depth with our tracking. Let's say you run 2 different ads with Google and 2 different ads with Yahoo. You want to track each link individually and view reports for each.

Create 4 different links.

- [tid1=google&tid2=pants](#)
- [tid1=google&tid2=shirts](#)
- [tid1=yahoo&tid2=pants](#)
- [tid1=yahoo&tid2=shirts](#)

Now let's add your own defined incoming traffic page to further track which links convert highest.

- [tid1=google&tid2=pants&url=82934723](#)

All these variables can be used separately or you can combine them all in one URL to create deeper reporting statistics.

Example: [sub_id=123&tid1=foo&tid2=bar&tid3=something&tid4=else&url=23452354](#)

The **Custom Tracking Reports** provide total hits, unique hits, number of sales, referring URL and the link's conversion rate. You can also export these reports to CSV for closer examination or import into your own tracking system.
